Comparing seal concepts: Metal-free HU oil filter elements

Numerous metal-free MANN-FILTER oil filter elements are designed with foil end caps (figure 1). For many years, these have provided a successful solution in both the aftermarket and OE sectors. The seal to the relevant matching part in the oil filter housing is achieved through the precisely fitting internal diameter on the end cap.

Figure 1

Circular sealing area

Besides the above mentioned solution, other designs such as plastic end caps which are sealed with fleece or rubber gasket are also available (figure 2).

Figure 2

Differences in appearance do not affect the element's function or quality in any way. MANN-FILTER products are always supplied in OE specification level, irrespective the design.
