Land Rover Freelander TD4,  
Range Rover TD6

EN

## Breather Valve for crankcase, with additional parts

**Problem**

Engine oil leak, usually from the dipstick tube, because the dipstick has been pushed out under pressure.

Other symptoms include lack of engine power; the engine will not increase in speed, black or blue exhaust smoke and excessive oil consumption.

**Cause**

Excessive crankcase pressure caused by a blocked crankcase breather filter, this is located in the depression control valve assembly, which is fitted to the camshaft cover.

**Solution**

Replace the blocked filter and the complete breather valve assembly. Clean any excess oil leaks and test.
