

febi 01791

To fit:

Volkswagen Beetle, Käfer (11 & 1B)
and Karman Ghia

EN

Upper-front axle guide joint

The original version of this guide joint was manufactured to work within certain movement restrictions. This required notches/location points in the flange to ensure the new part was correctly aligned with the indicator points on the suspension arm when being installed. (Fig.1)

If the guide joint was installed incorrectly, the steering/suspension system would bind - resulting in a vastly reduced service life and potential failure of the guide joint.

The new febi replacement part 01791 has been re-engineered so that the ball pin has 360 degrees of movement and does not need to be aligned with the indicators on the suspension arm, making installation easier. Therefore, there are no requirements for the notches/location points. (Fig.2)
