Be on the Safe Side - With Beacons from febi

Beacons are available in many different variations. However, certain properties are important in order to meet all the legal requirements. The febi 104050 LED beacon meets all of them – from ECE R65 and R10 to EMC and ADR. This means it can be used for all vehicles and applications, including on cars, trucks, and within the agricultural sector. Furthermore, it is designed for a long service life. It has a replaceable glass (febi 104039) made of extremely stable and impact-resistant polycarbonate. The bracket for mounting on a DIN holder is designed to be flexible and will not break immediately in the event of accidental contact with an obstacle. The high IP67 protection class against the ingress of water and dust is also not always a matter of course with other manufacturers. Due to the wide voltage range of 9-30 volts, it can be operated on nearly all vehicles. The LED version also offers other advantages such as different flash patterns (rotation, single flash, double flash, rapid flash) and a longer service life and durability compared to versions with incandescent lamps.

In addition to the matching replacement lenses and DIN holders in various designs for rotating beacons, febi also offers a comprehensive range of worklights and strobe lights in OE matching quality for all common applications in the commercial vehicle sector.
